- $\rightarrow$  The ratio R = k/n is called the *code rate*, and it can be interpreted as the number of information bits entering the encoder per transmitted symbol
- $\rightarrow$  Each message is encoded independently, so the encoder is memoryless and can be implemented with a *combinatorial logic circuit*

Bibhas Adhikari (Spring 2022-23, IIT Kharag

**Definition** A block code of length n and  $2^k$  codewords is called a linear (n, k)-code if and only if its  $2^k$  codewords form a k-dimensional subspace of the vector space of all n-tuples over the field GF(2), the Galois Field of order 2

Definition A block code of length n and  $2^k$  codewords is called a linear (n, k)-code if and only if its  $2^k$  codewords form a k-dimensional subspace of the vector space of all n-tuples over the field GF(2), the Galois Field of order 2

#### Conclusion

- $\bigtriangleup$  A binary block code is linear if and only if the modulo-2 sum of two codewords is also a codeword
- $\triangle$  Since (n, k) linear block code C is a k-dimension subspace of  $V_n$ , the vector space of all binary n-tuples, it is possible to find k linearly independent codewords  $\mathbf{g}_0, \mathbf{g}_1, \ldots, \mathbf{g}_{k-1}$  in C such that any codeword  $\mathbf{v}$  in C can be written as

$$v = u_0 \mathbf{g}_0 + u_1 \mathbf{g}_1 + \ldots u_{k-1} \mathbf{g}_{k-1}$$

where 
$$u_i \in \{0, 1\}, 0 \le i \le k - 1$$

Write

$$\mathbf{G} = \begin{bmatrix} \mathbf{g}_0 \\ \mathbf{g}_1 \\ \vdots \\ \mathbf{g}_{k-1} \end{bmatrix} = \begin{bmatrix} g_{00} & g_{01} & \cdots & g_{0,n-1} \\ g_{10} & g_{11} & \cdots & g_{1,n-1} \\ \vdots & \vdots & \vdots & \vdots \\ g_{k-1,0} & g_{k-1,1} & \cdots & g_{k-1,n-1} \end{bmatrix}_{k \times n}$$

where

$$\mathbf{g}_i = (g_{i0}, g_{i1}, \dots, g_{i,n-1}), 0 \le i \le k-1.$$

イロト イヨト イヨト イヨト

æ

Write

$$\mathbf{G} = \begin{bmatrix} \mathbf{g}_0 \\ \mathbf{g}_1 \\ \vdots \\ \mathbf{g}_{k-1} \end{bmatrix} = \begin{bmatrix} g_{00} & g_{01} & \cdots & g_{0,n-1} \\ g_{10} & g_{11} & \cdots & g_{1,n-1} \\ \vdots & \vdots & \vdots & \vdots \\ g_{k-1,0} & g_{k-1,1} & \cdots & g_{k-1,n-1} \end{bmatrix}_{k \times n}$$

where

$$\mathbf{g}_i = (g_{i0}, g_{i1}, \dots, g_{i,n-1}), 0 \le i \le k-1.$$

Then

$$\mathbf{v} = \mathbf{u} \cdot \mathbf{G}$$
  
=  $u_0 \mathbf{g}_0 + u_1 \mathbf{g}_1 + \dots + \dots, u_{k-1} \mathbf{g}_{k-1}$

3

Then the code C is just the null-space of H, which is called a parity-check matrix of the code.

Note The rows of **H** also generate a (n, n - k) linear code  $C_d$ , which is called the dual code of C.

Problem The code  $C_d$  is the null space **G**.

If the generator matrix of an (n, k) linear code is in the systematic form then the parity-check matrix can be in the following form:

$$\mathbf{H} = \begin{bmatrix} I_{n-k} & \mathbf{P}^T \end{bmatrix}.$$

$$\mathbf{H} = \begin{bmatrix} I_{n-k} & \mathbf{P}^T \end{bmatrix}.$$

Then see that

$$\mathbf{G}\cdot\mathbf{H}^{\mathcal{T}}=\mathbf{0}.$$
