Question revisited -  $\Sigma = \{0, 1\}$ . Let  $\mathcal{X} = \{a, b, c, d\}$  with p(a) = 1/2, p(b) = 1/4, p(c) = 1/8 and p(d) = 1/8. How do we design a code for  $\mathcal{X}$  such that expected length of the code is minimized?

< □ > < 同 > < 回 > < 回 > < 回 >

Question revisited -  $\Sigma = \{0, 1\}$ . Let  $\mathcal{X} = \{a, b, c, d\}$  with p(a) = 1/2, p(b) = 1/4, p(c) = 1/8 and p(d) = 1/8. How do we design a code for  $\mathcal{X}$  such that expected length of the code is minimized?

Answer a = 0, b = 10, c = 110, d = 111

The Shannon code A prefix-free code for a rv X with at most H(X) + 1 bits on average can be constructed, known as Shannon code.

For an element  $x \in \mathcal{X}$ , which occurs with probability p(x), use a codeword of length  $\lceil \log(1/p(x)) \rceil$ . By Kraft's inequality, such a prefix-free code since

$$\sum_{\mathsf{x}\in\mathcal{X}}\frac{1}{2^{|\mathsf{C}(\mathsf{x})|}} = \sum_{\mathsf{x}\in\mathcal{X}}\frac{1}{2^{\lceil\log(1/p(\mathsf{x}))\rceil}} \leq \sum_{\mathsf{x}\in\mathcal{X}}\frac{1}{2^{\log(1/p(\mathsf{x}))}} = \sum_{\mathsf{x}\in\mathcal{X}}p(\mathsf{x}) = 1$$

Answer a = 0, b = 10, c = 110, d = 111

The Shannon code A prefix-free code for a rv X with at most H(X) + 1 bits on average can be constructed, known as Shannon code. For an element  $x \in \mathcal{X}$ , which occurs with probability p(x), use a codeword

of length  $\lceil \log(1/p(x)) \rceil$ . By Kraft's inequality, such a prefix-free code since

$$\sum_{x \in \mathcal{X}} \frac{1}{2^{|\mathcal{C}(x)|}} = \sum_{x \in \mathcal{X}} \frac{1}{2^{\lceil \log(1/p(x)) \rceil}} \le \sum_{x \in \mathcal{X}} \frac{1}{2^{\log(1/p(x))}} = \sum_{x \in \mathcal{X}} p(x) = 1$$

the expected number of bits used is

$$\sum_{x\in\mathcal{X}}p(x)\cdot \lceil \log(1/p(x))
ceil \leq \sum_{x\in\mathcal{X}}p(x)\cdot (\log(1/p(x))+1)=H(X)+1.$$
