Statistic If X_1, X_2, \ldots, X_n is a random sample from a population then a statistic is a function of X_i s.

Statistic If $X_1, X_2, ..., X_n$ is a random sample from a population then a statistic is a function of X_i s.

Sampling distribution If the distribution of the population is known then often it is possible to find the probability distribution of the statistics associated with the population. If T is such a statistic then the distribution of T is called the sampling distribution of T.

Student's *t*-distribution This distribution was discovered by W. S. Gosset (1876-1936) who published his work under the pseudonym of student. Thus it is known as Student's *t*-distribution. This distribution is a generalization of Cauchy distribution and normal distribution.

A continuous random variable X is said to have a *t*-distribution with ν degrees of freedom if the pdf is of the form

$$f(x;\nu) = \frac{\Gamma\left(\frac{\nu+1}{2}\right)}{\sqrt{\pi\nu} \,\Gamma\left(\frac{\nu}{2}\right) \left(1 + \frac{x^2}{\nu}\right)^{\left(\frac{\nu+1}{2}\right)}, \ -\infty < x < \infty$$

where $\nu > 0$.

.

Student's *t*-distribution This distribution was discovered by W. S. Gosset (1876-1936) who published his work under the pseudonym of student. Thus it is known as Student's *t*-distribution. This distribution is a generalization of Cauchy distribution and normal distribution.

A continuous random variable X is said to have a *t*-distribution with ν degrees of freedom if the pdf is of the form

$$f(x;\nu) = \frac{\Gamma\left(\frac{\nu+1}{2}\right)}{\sqrt{\pi\nu} \,\Gamma\left(\frac{\nu}{2}\right) \left(1 + \frac{x^2}{\nu}\right)^{\left(\frac{\nu+1}{2}\right)}, \ -\infty < x < \infty$$

where $\nu > 0$.

If X has *t*-distribution then we write $X \sim t(\nu)$

- 4 回 ト 4 ヨ ト 4 ヨ ト

Setting $\nu = 1$, the pdf of *t*-distribution becomes

$$f(x;1) = \frac{1}{\pi(1+x^2)}, -\infty < x < \infty,$$

which is the pdf of Cauchy distribution.

Setting $\nu = 1$, the pdf of *t*-distribution becomes

$$f(x;1) = \frac{1}{\pi(1+x^2)}, -\infty < x < \infty,$$

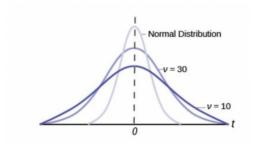

which is the pdf of Cauchy distribution.

Setting $\nu \to \infty$ then

$$\lim_{\nu \to \infty} f(x; \nu) = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}x^2}, -\infty < x < \infty$$

which is the pdf of standard normal distribution.

Sampling distributions Properties of *t*-distribution If $X \sim t(\nu)$ then

$$E(X) = \begin{cases} 0, \text{ if } \nu \ge 2\\ \text{DNE}, \text{ if } \nu = 1 \end{cases}$$

and

$$Var(X) = \begin{cases} rac{
u}{
u-2}, & ext{if }
u \geq 3 \\ ext{DNE}, & ext{if }
u = 1,2 \end{cases}$$

where DNE means does not exist.

Sampling distributions Properties of *t*-distribution If $X \sim t(\nu)$ then

$$E(X) = \begin{cases} 0, \text{ if } \nu \geq 2\\ \text{DNE, if } \nu = 1 \end{cases}$$

and

$$Var(X) = \begin{cases} rac{
u}{
u-2}, & ext{if }
u \geq 3 \\ ext{DNE}, & ext{if }
u = 1,2 \end{cases}$$

where DNE means does not exist.

If $Z \sim \mathcal{N}(0,1)$ and $U \sim \chi^2(\nu)$ and in addition, Z and U are independent, then the random variable W defined by

$$W = \frac{Z}{\frac{U}{\nu}}$$

has a *t*-distribution with ν degrees of freedom.

Bibhas Adhikari (Autumn 2022-23, IIT Khara

If $X \sim \mathcal{N}(\mu, \sigma^2)$ and X_1, X_2, \ldots, X_n be a random sample from the population X, then

$$\frac{\overline{X}-\mu}{\frac{S}{\sqrt{n}}} \sim t(n-1)$$

If $X \sim \mathcal{N}(\mu, \sigma^2)$ and X_1, X_2, \ldots, X_n be a random sample from the population X, then

$$\frac{\overline{X}-\mu}{\frac{S}{\sqrt{n}}} \sim t(n-1)$$

Proof Since $X_i \sim \mathcal{N}(\mu, \sigma^2), \overline{X} \sim \mathcal{N}\left(\mu, \frac{\sigma^2}{n}\right)$. Thus $\frac{\overline{X} - \mu}{\frac{\sigma}{\sqrt{n}}} \sim \mathcal{N}(0, 1)$.

If $X \sim \mathcal{N}(\mu, \sigma^2)$ and X_1, X_2, \dots, X_n be a random sample from the population X, then

$$\frac{\overline{X}-\mu}{\frac{S}{\sqrt{n}}} \sim t(n-1)$$

Proof Since
$$X_i \sim \mathcal{N}(\mu, \sigma^2), \overline{X} \sim \mathcal{N}\left(\mu, \frac{\sigma^2}{n}\right)$$
. Thus $\frac{\overline{X} - \mu}{\frac{\sigma}{\sqrt{n}}} \sim \mathcal{N}(0, 1)$.

Further we know

$$\frac{(n-1)}{\sigma^2}S^2 \sim \chi^2(n-1).$$

If $X \sim \mathcal{N}(\mu, \sigma^2)$ and X_1, X_2, \dots, X_n be a random sample from the population X, then

$$\frac{\overline{X}-\mu}{\frac{S}{\sqrt{n}}} \sim t(n-1)$$

Proof Since
$$X_i \sim \mathcal{N}(\mu, \sigma^2), \overline{X} \sim \mathcal{N}\left(\mu, \frac{\sigma^2}{n}\right)$$
. Thus $\frac{\overline{X} - \mu}{\frac{\sigma}{\sqrt{n}}} \sim \mathcal{N}(0, 1)$.

Further we know

$$\frac{(n-1)}{\sigma^2}S^2 \sim \chi^2(n-1).$$

Hence

$$\frac{\overline{X} - \mu}{\frac{S}{\sqrt{n}}} = \frac{\frac{\overline{X} - \mu}{\frac{\sigma}{\sqrt{n}}}}{\sqrt{\frac{(n-1)S^2}{(n-1)\sigma^2}}} \sim t(n-1) \text{ (by previous result)}$$

(Snedecor's) *F*-distribution The *F*-distribution was named in the honr of Ronald Fisher by george Snedecor.

(Snedecor's) *F*-distribution The *F*-distribution was named in the honr of Ronald Fisher by george Snedecor.

A continuous random variable X is said to have a F-distribution with degrees of freedom ν_1 and ν_2 if its pdf is of the form

$$f(x;\nu_{1},\nu_{2}) = \begin{cases} \frac{\Gamma(\frac{\nu_{1}+\nu_{2}}{2})(\frac{\nu_{1}}{\nu_{2}})^{\frac{\nu_{1}}{2}}x^{\frac{\nu_{1}}{2}-1}}{\Gamma(\frac{\nu_{1}}{2})\Gamma(\frac{\nu_{2}}{2})(1+\frac{\nu_{1}}{\nu_{2}}x)^{(\frac{\nu_{1}+\nu_{2}}{2})}, & \text{if } 0 \le x < \infty\\ 0, & \text{otherwise} \end{cases}$$

where $\nu_1, \nu_2 > 0$.

Let $X \sim \mathcal{N}(\mu_1, \sigma_1^2)$ and X_1, \ldots, X_n be random sample of size *n* from a population *X*. Let $Y \sim \mathcal{N}(\mu_2, \sigma_2^2)$ and Y_1, \ldots, Y_m be a random sample of size *m* from the population *Y*. Then the statistic

$$rac{S_1^2}{\sigma_1^2} \sum_{\substack{{j=2}\{{S_2^2}}\\{{\sigma_2^2}}}} \sim F(n-1,m-1),$$

where S_1^2 and S_2^2 are sample variances of the samples X_i s and Y_j s respectively.

Let $X \sim \mathcal{N}(\mu_1, \sigma_1^2)$ and X_1, \ldots, X_n be random sample of size *n* from a population *X*. Let $Y \sim \mathcal{N}(\mu_2, \sigma_2^2)$ and Y_1, \ldots, Y_m be a random sample of size *m* from the population *Y*. Then the statistic

$$rac{S_1^2}{\sigma_1^2} \sim F(n-1,m-1), \ \sigma_2^2$$

where S_1^2 and S_2^2 are sample variances of the samples X_i s and Y_j s respectively.

Proof Since
$$X_i \sim \mathcal{N}(\mu_1, \sigma_1^2)$$
, $(n-1)\frac{S_1^2}{\sigma_1^2} \sim \chi^2(n-1)$. Similarly, since $Y_i \sim \mathcal{N}(\mu_2, \sigma_2^2)$, $(m-1)\frac{S_2^2}{\sigma_2^2} \sim \chi^2(m-1)$

Let $X \sim \mathcal{N}(\mu_1, \sigma_1^2)$ and X_1, \ldots, X_n be random sample of size *n* from a population *X*. Let $Y \sim \mathcal{N}(\mu_2, \sigma_2^2)$ and Y_1, \ldots, Y_m be a random sample of size *m* from the population *Y*. Then the statistic

$$rac{S_1^2}{\sigma_1^2} \sim F(n-1,m-1), \ \sigma_2^2$$

where S_1^2 and S_2^2 are sample variances of the samples X_i s and Y_j s respectively.

Proof Since
$$X_i \sim \mathcal{N}(\mu_1, \sigma_1^2)$$
, $(n-1)\frac{S_1^2}{\sigma_1^2} \sim \chi^2(n-1)$. Similarly, since
 $Y_i \sim \mathcal{N}(\mu_2, \sigma_2^2)$, $(m-1)\frac{S_2^2}{\sigma_2^2} \sim \chi^2(m-1)$ Therefore
 $\frac{\frac{S_1^2}{\sigma_1^2}}{\frac{S_2^2}{\sigma_2^2}} = \frac{\frac{(n-1)S_1^2}{(n-1)\sigma_1^2}}{\frac{(m-1)S_2^2}{(m-1)\sigma_2^2}} \sim F(n-1, m-1).$
