- □ Probability theory Kolmogorov
- \Box Probability theory \mapsto Mathematical statistics

Sample space

- Discrete sample space countable sample points
- Continuous sample space uncountable sample points
- □ Example: roll a pair of dice:

4 3 5 4 3 5 5

- □ Probability theory Kolmogorov
- \Box Probability theory \mapsto Mathematical statistics

Sample space

- Discrete sample space countable sample points
- Continuous sample space uncountable sample points

□ Example: roll a pair of dice:

$$S = \{(x, y) : 1 \le x \le 6, 1 \le y \le 6\}$$

Events: sum of the outcomes is equal to 8

4 3 5 4 3 5 5

σ -field

A set $A \subseteq S$ is an event if $A \in \mathcal{F} \subset \mathcal{P}(S)$, power set of S such that

- $S \in \mathcal{F}$
- if $A \in \mathcal{F}$ then $A^c \in \mathcal{F}$
- if $A_j \in \mathcal{F}, j \ge 1$ then $\bigcup_{j=1}^{\infty} A_j \in \mathcal{F}$

Question: Why do we need the notion of σ -field?

Question: Probability of what?

2

A D N A B N A B N A B N

Question: Probability of what?

• Frequentist Interpretation of Probability and classical definition

$$P(A) = \frac{n(A)}{n(S)} = \frac{\#A}{\#S}$$

э

(B)

Question: Probability of what?

• Frequentist Interpretation of Probability and classical definition

$$P(A) = \frac{n(A)}{n(S)} = \frac{\#A}{\#S}$$

Probability measure (axiomatic definition)

Probability is function $P:\mathcal{F}\to [0\ 1]$ - it assigns nonnegative numbers to events such that

- P(S) = 1
- (addition rule)

$$P\left(\bigcup_{k=1}^{\infty}A_k\right)=\sum_{k=1}^{\infty}P(A_k)$$

if $A_1, A_2, \ldots, A_k, \ldots$ are disjoint events of S

э

(日)

Properties of probability

- $P(\emptyset) = 0$
- For any finite collection of mutually exclusive events: $\{A_1, A_1, \dots, A_n\}$ with $A_i \cap A_j = \emptyset$ if $i \neq j$ then

$$P\left(\bigcup_{k=1}^n A_k\right) = \sum_{k=1}^n P(A_k)$$

• For a discrete sample space $S = \{s_1, s_2, \ldots\},$

$$P(S) = \sum_{k=1}^{\infty} P(\{s_k\})$$

3

< □ > < □ > < □ > < □ > < □ > < □ >

Properties of probability

- $P(\emptyset) = 0$
- For any finite collection of mutually exclusive events: $\{A_1, A_1, \dots, A_n\}$ with $A_i \cap A_j = \emptyset$ if $i \neq j$ then

$$P\left(\bigcup_{k=1}^n A_k\right) = \sum_{k=1}^n P(A_k)$$

• For a discrete sample space $S = \{s_1, s_2, \ldots\},$

$$P(S) = \sum_{k=1}^{\infty} P(\{s_k\})$$

Question: Does P(A) = 1 imply A = S?

- 3

< ロ > < 同 > < 回 > < 回 > < 回 > <

Question: Is the axiomatic definition a more general definition than the classical one?

3

A D N A B N A B N A B N

Question: Is the axiomatic definition a more general definition than the classical one?

Derive: for equally likely sample points,

$$P(A) = \frac{\#A}{\#S}$$

3

A B A A B A

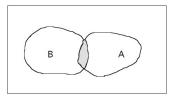

Some more properties of probability measure (use Venn diagram)

- $P(A^c) = 1 P(A)$
- if $A \subseteq B \subseteq S$ then $P(A) \leq P(B)$
- $P(A \cup B) = P(A) + P(B) P(A \cap B)$
- Let $A_1 \subseteq A_2$. Then

$$P(A_2 \setminus A_1) = P(A_2) - P(A_1)$$

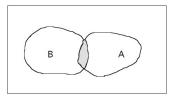

Problems:

くぼう くさう くさう しき

Question: For a finite sample space, how do we define probability of Agiven that *B* has happened?

э

Question: For a finite sample space, how do we define probability of Agiven that *B* has happened?

$$P(A \text{ given } B) = \frac{\text{number of elements of } A \cap B}{\text{number of elements of } B}$$

Bibhas Adhikari (Autumn 2022-23, IIT Khara

э

Conditional probability

For both discrete and continuous sample space:

$$P(A|B) = rac{P(A \cap B)}{P(B)}$$

provided P(B) > 0.

3

< □ > < □ > < □ > < □ > < □ > < □ >

Conditional probability

For both discrete and continuous sample space:

$$P(A|B) = rac{P(A \cap B)}{P(B)}$$

provided P(B) > 0.

Conditional probability measure:

- $P(A|B) \ge 0$ for all event A
- P(B|B) = 1
- (addition rule)

$$P\left(\bigcup_{k=1}^{\infty}A_k|B\right)=\sum_{k=1}^{\infty}P(A_k|B)$$

for mutually exclusive events $A_1, A_2, \ldots, A_k, \ldots$
