# A moving phone experiences signal strength variations

# Signal strength affects radio power and throughput

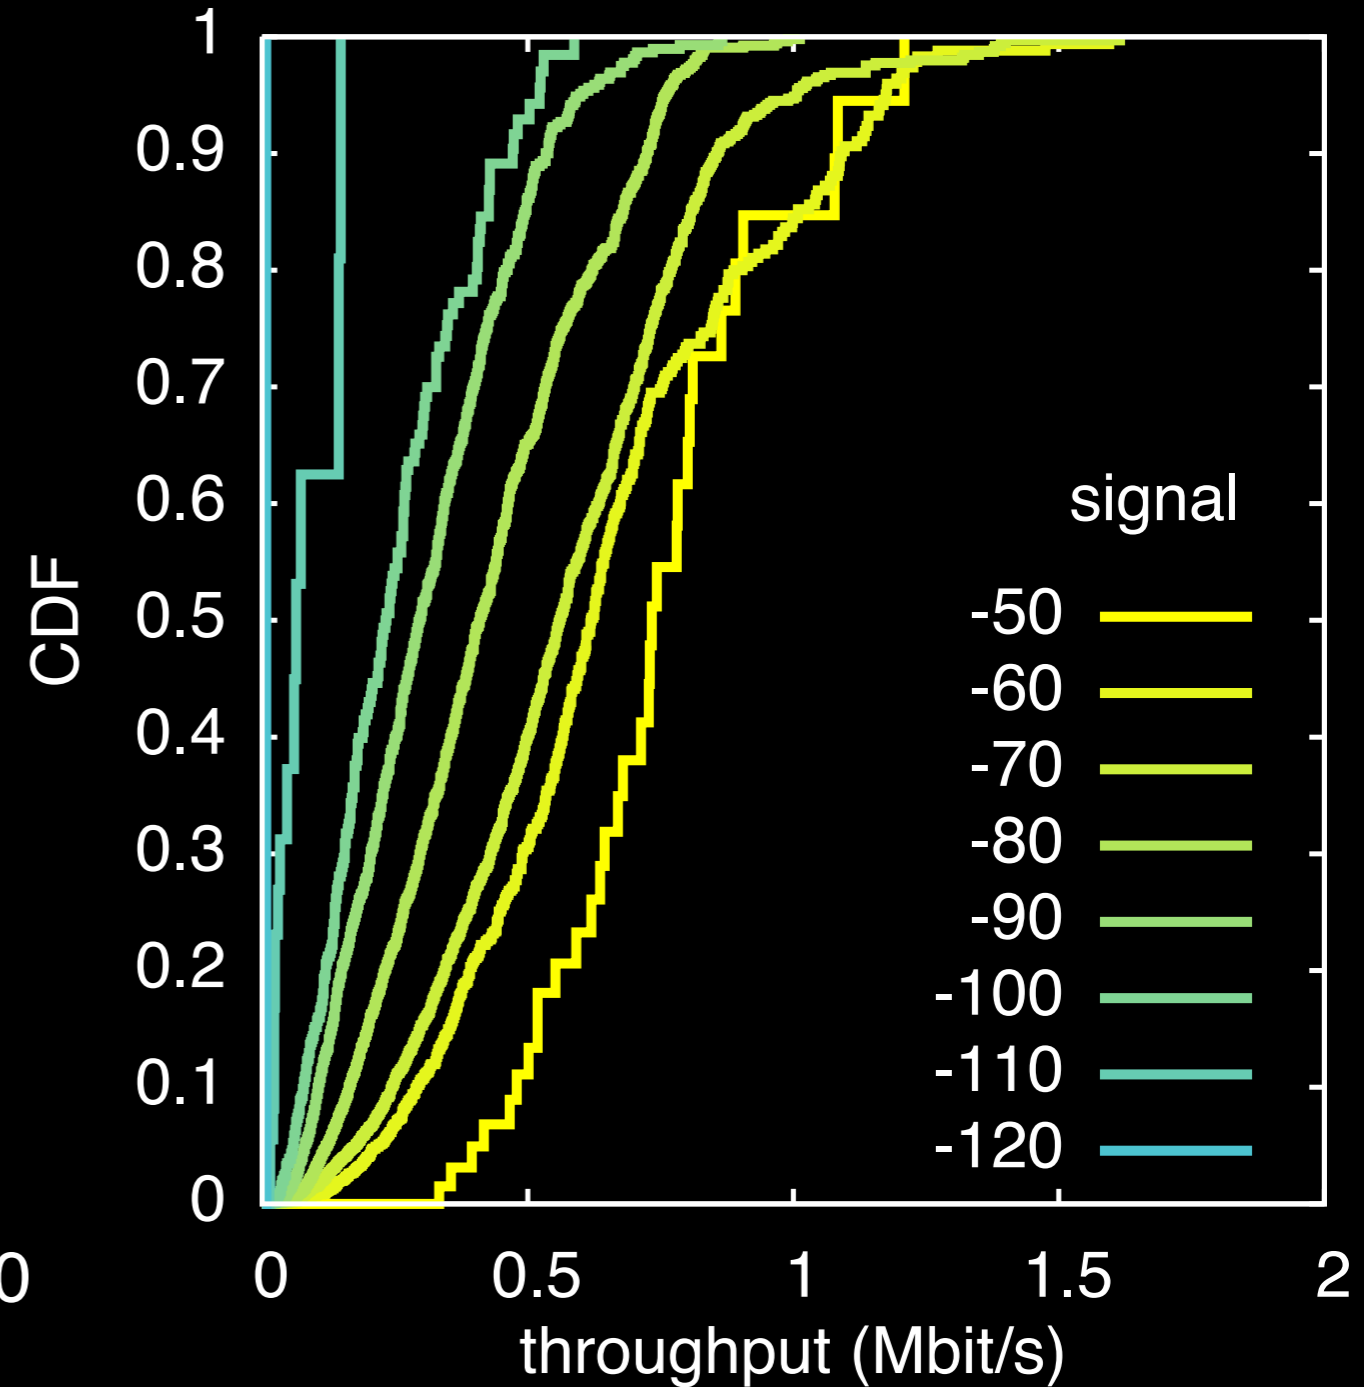

# Signal strength affects radio power and throughput

# Signal strength affects radio power and throughput

# Signal strength affects radio power and throughput

# Energy efficiency can be improved

---

A moving phone experiences signal strength variations.  
Signal strength affects communication energy.

Applications can hold off until signal increases and prefetch while signal is strong.

# Energy efficiency can be improved

---

A moving phone experiences signal strength variations.  
Signal strength affects communication energy.

Applications can hold off until signal increases and prefetch while signal is strong.

# Applications can receive when signal is strong

---

Background **sync** - 5 min interval sync could be more efficient if done sometime between 4 to 6 min

**Streaming** media - Consume buffer when the signal is weak, prefetch when the signal is strong

# Application energy measurements

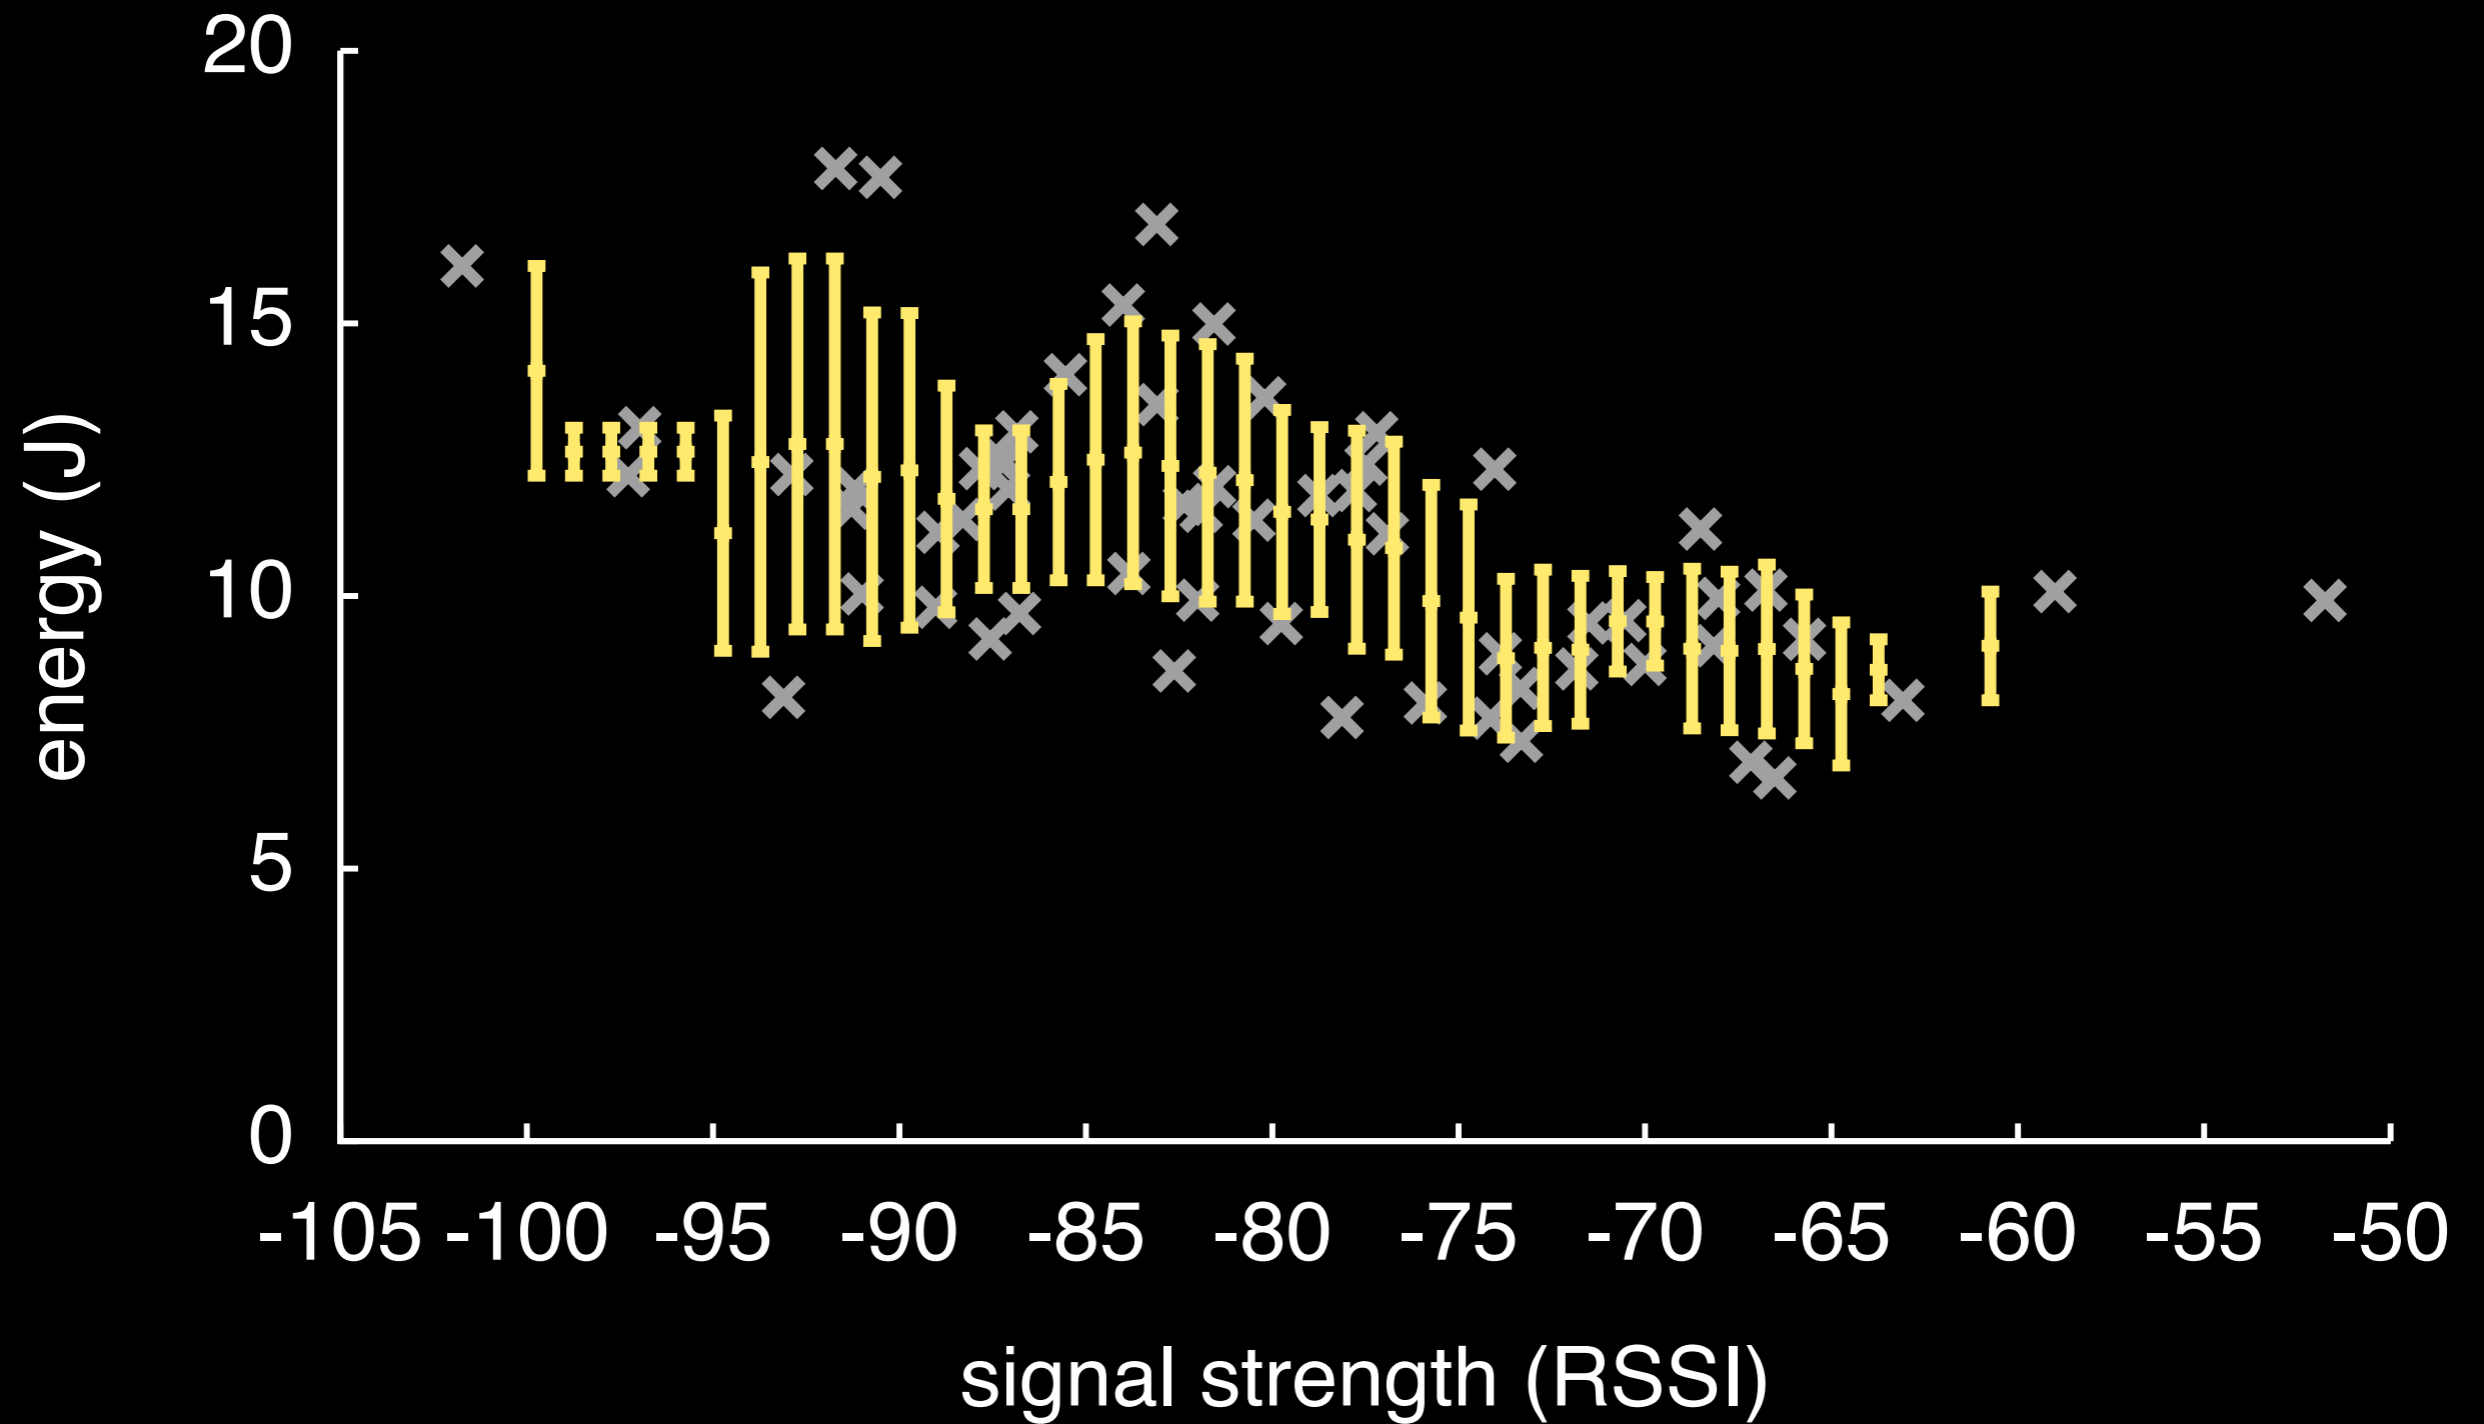

---

Drove with a mobile power monitor connected to a  
Palm Pre

# Email sync energy consumption

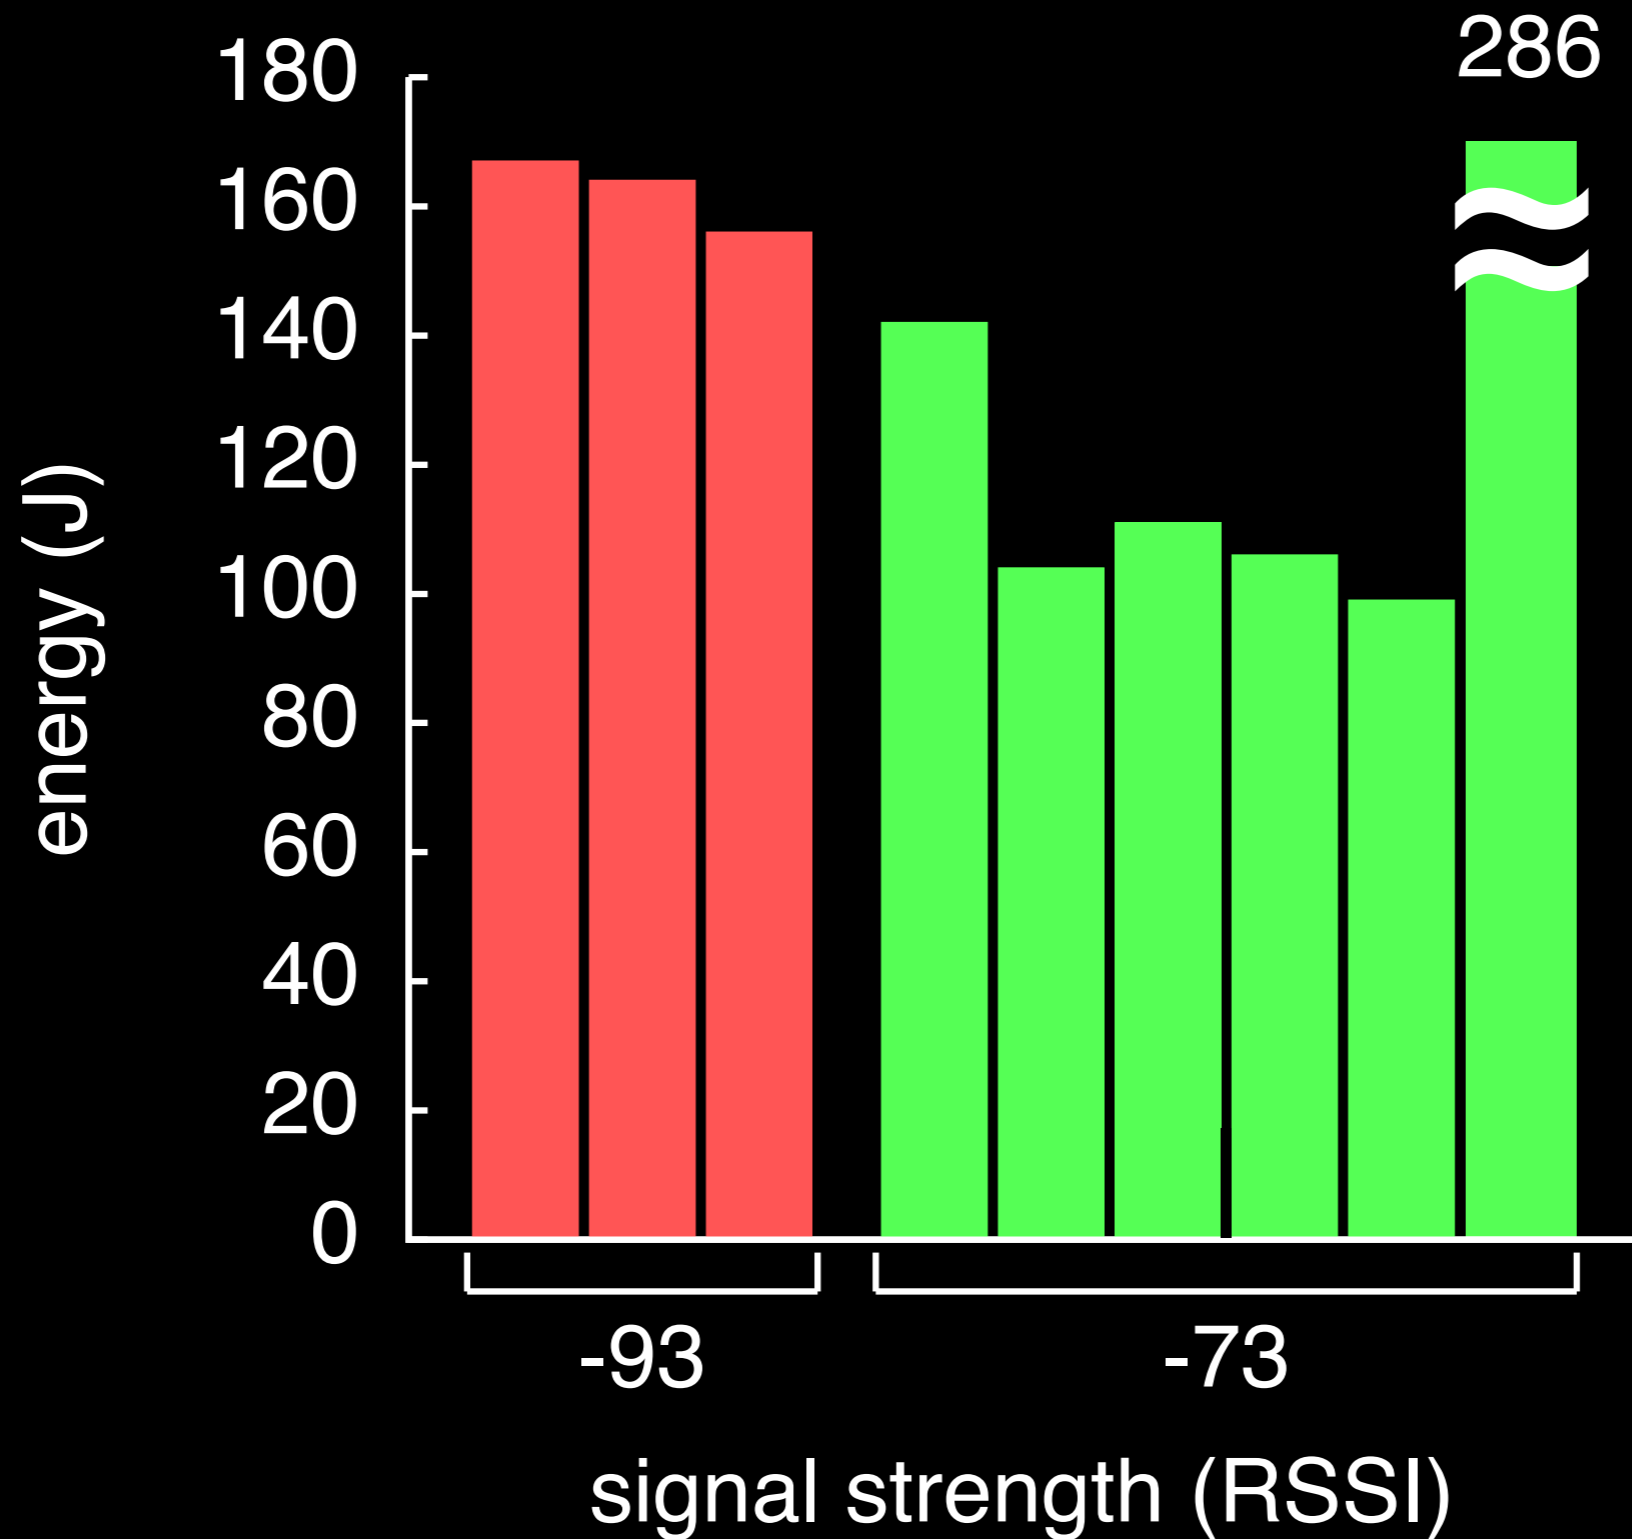

---

# Email sync energy consumption

# YouTube energy consumption

# Applications must schedule communication

**Sync**  
Schedule wakeup

**Streaming**  
Fill the buffer efficiently

## Problem

When to schedule communication to save energy?

Predict signal strength

↳ Schedule syncs

↳ Schedule streaming

# Applications must schedule communication

**Sync**  
Schedule wakeup

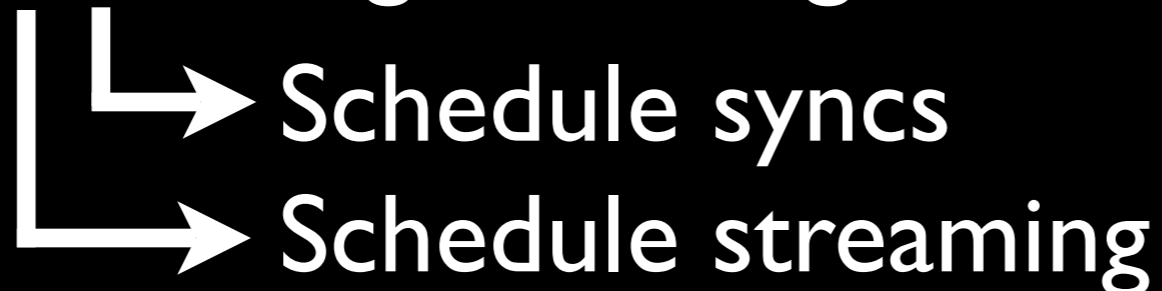

**Streaming**  
Fill the buffer efficiently

## Problem

When to schedule communication to save energy?

Predict signal strength

## Challenge

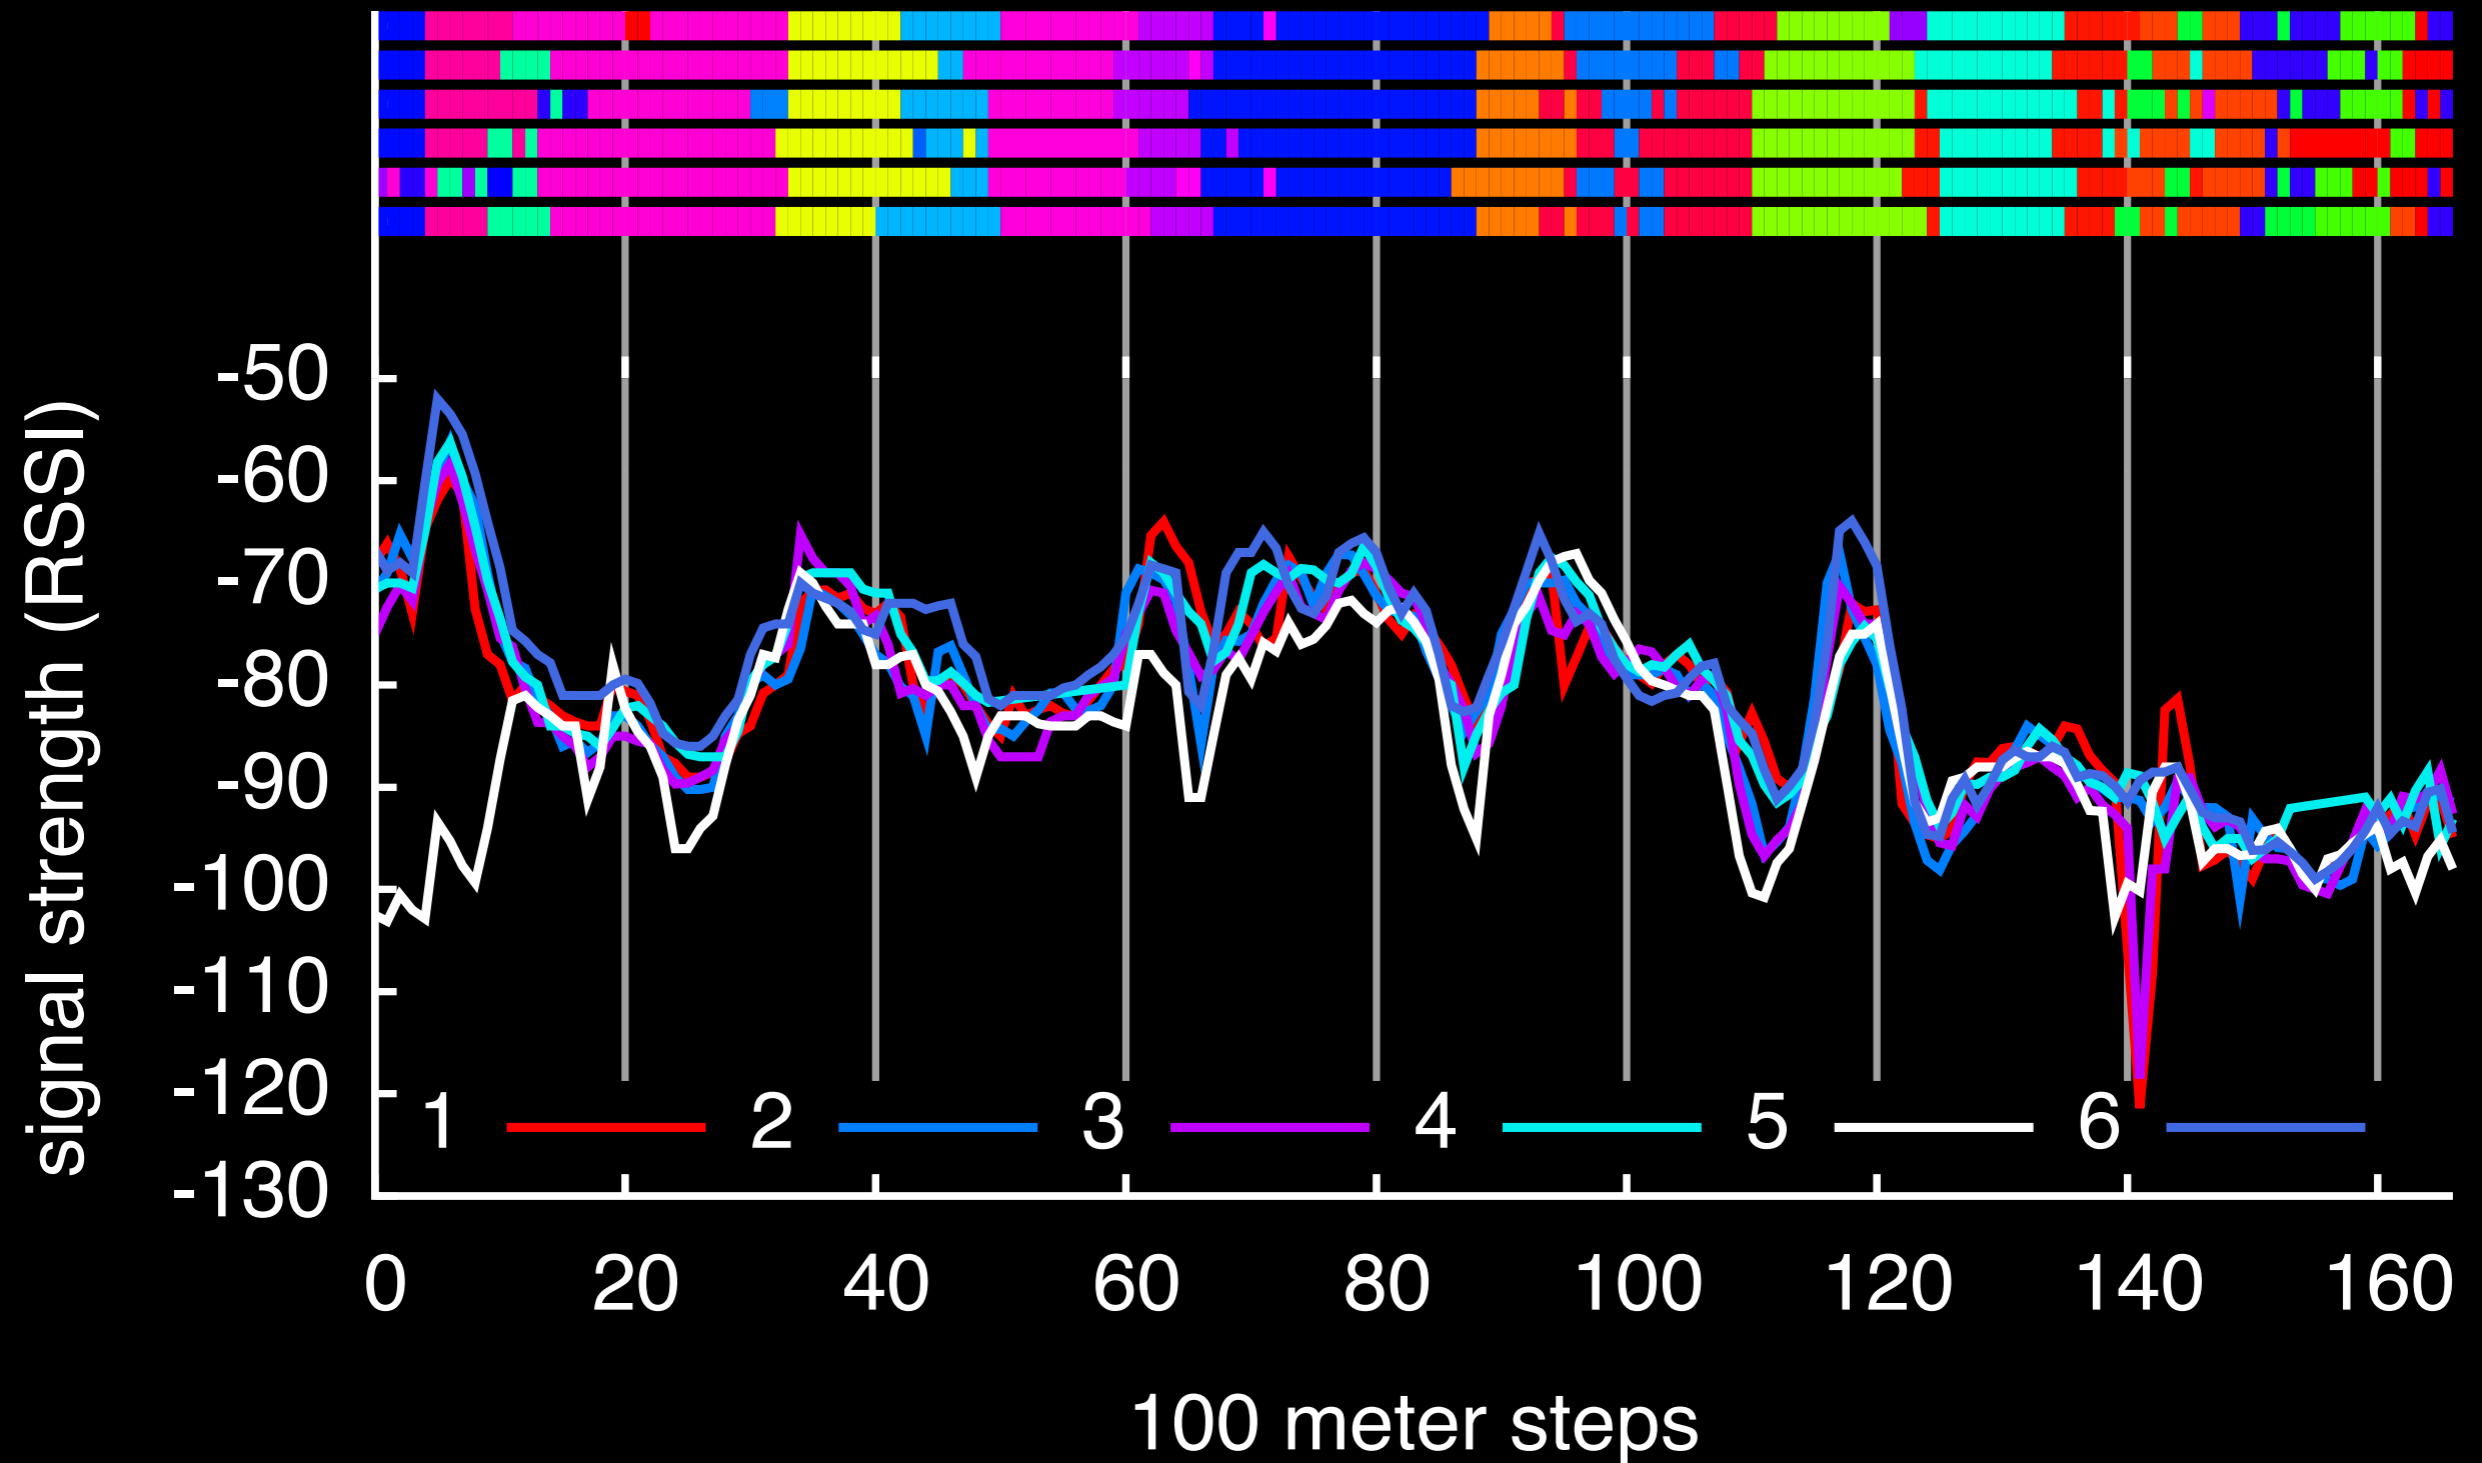

Scheduling must save more energy than it consumes.

# Obstacles to energy efficient scheduling

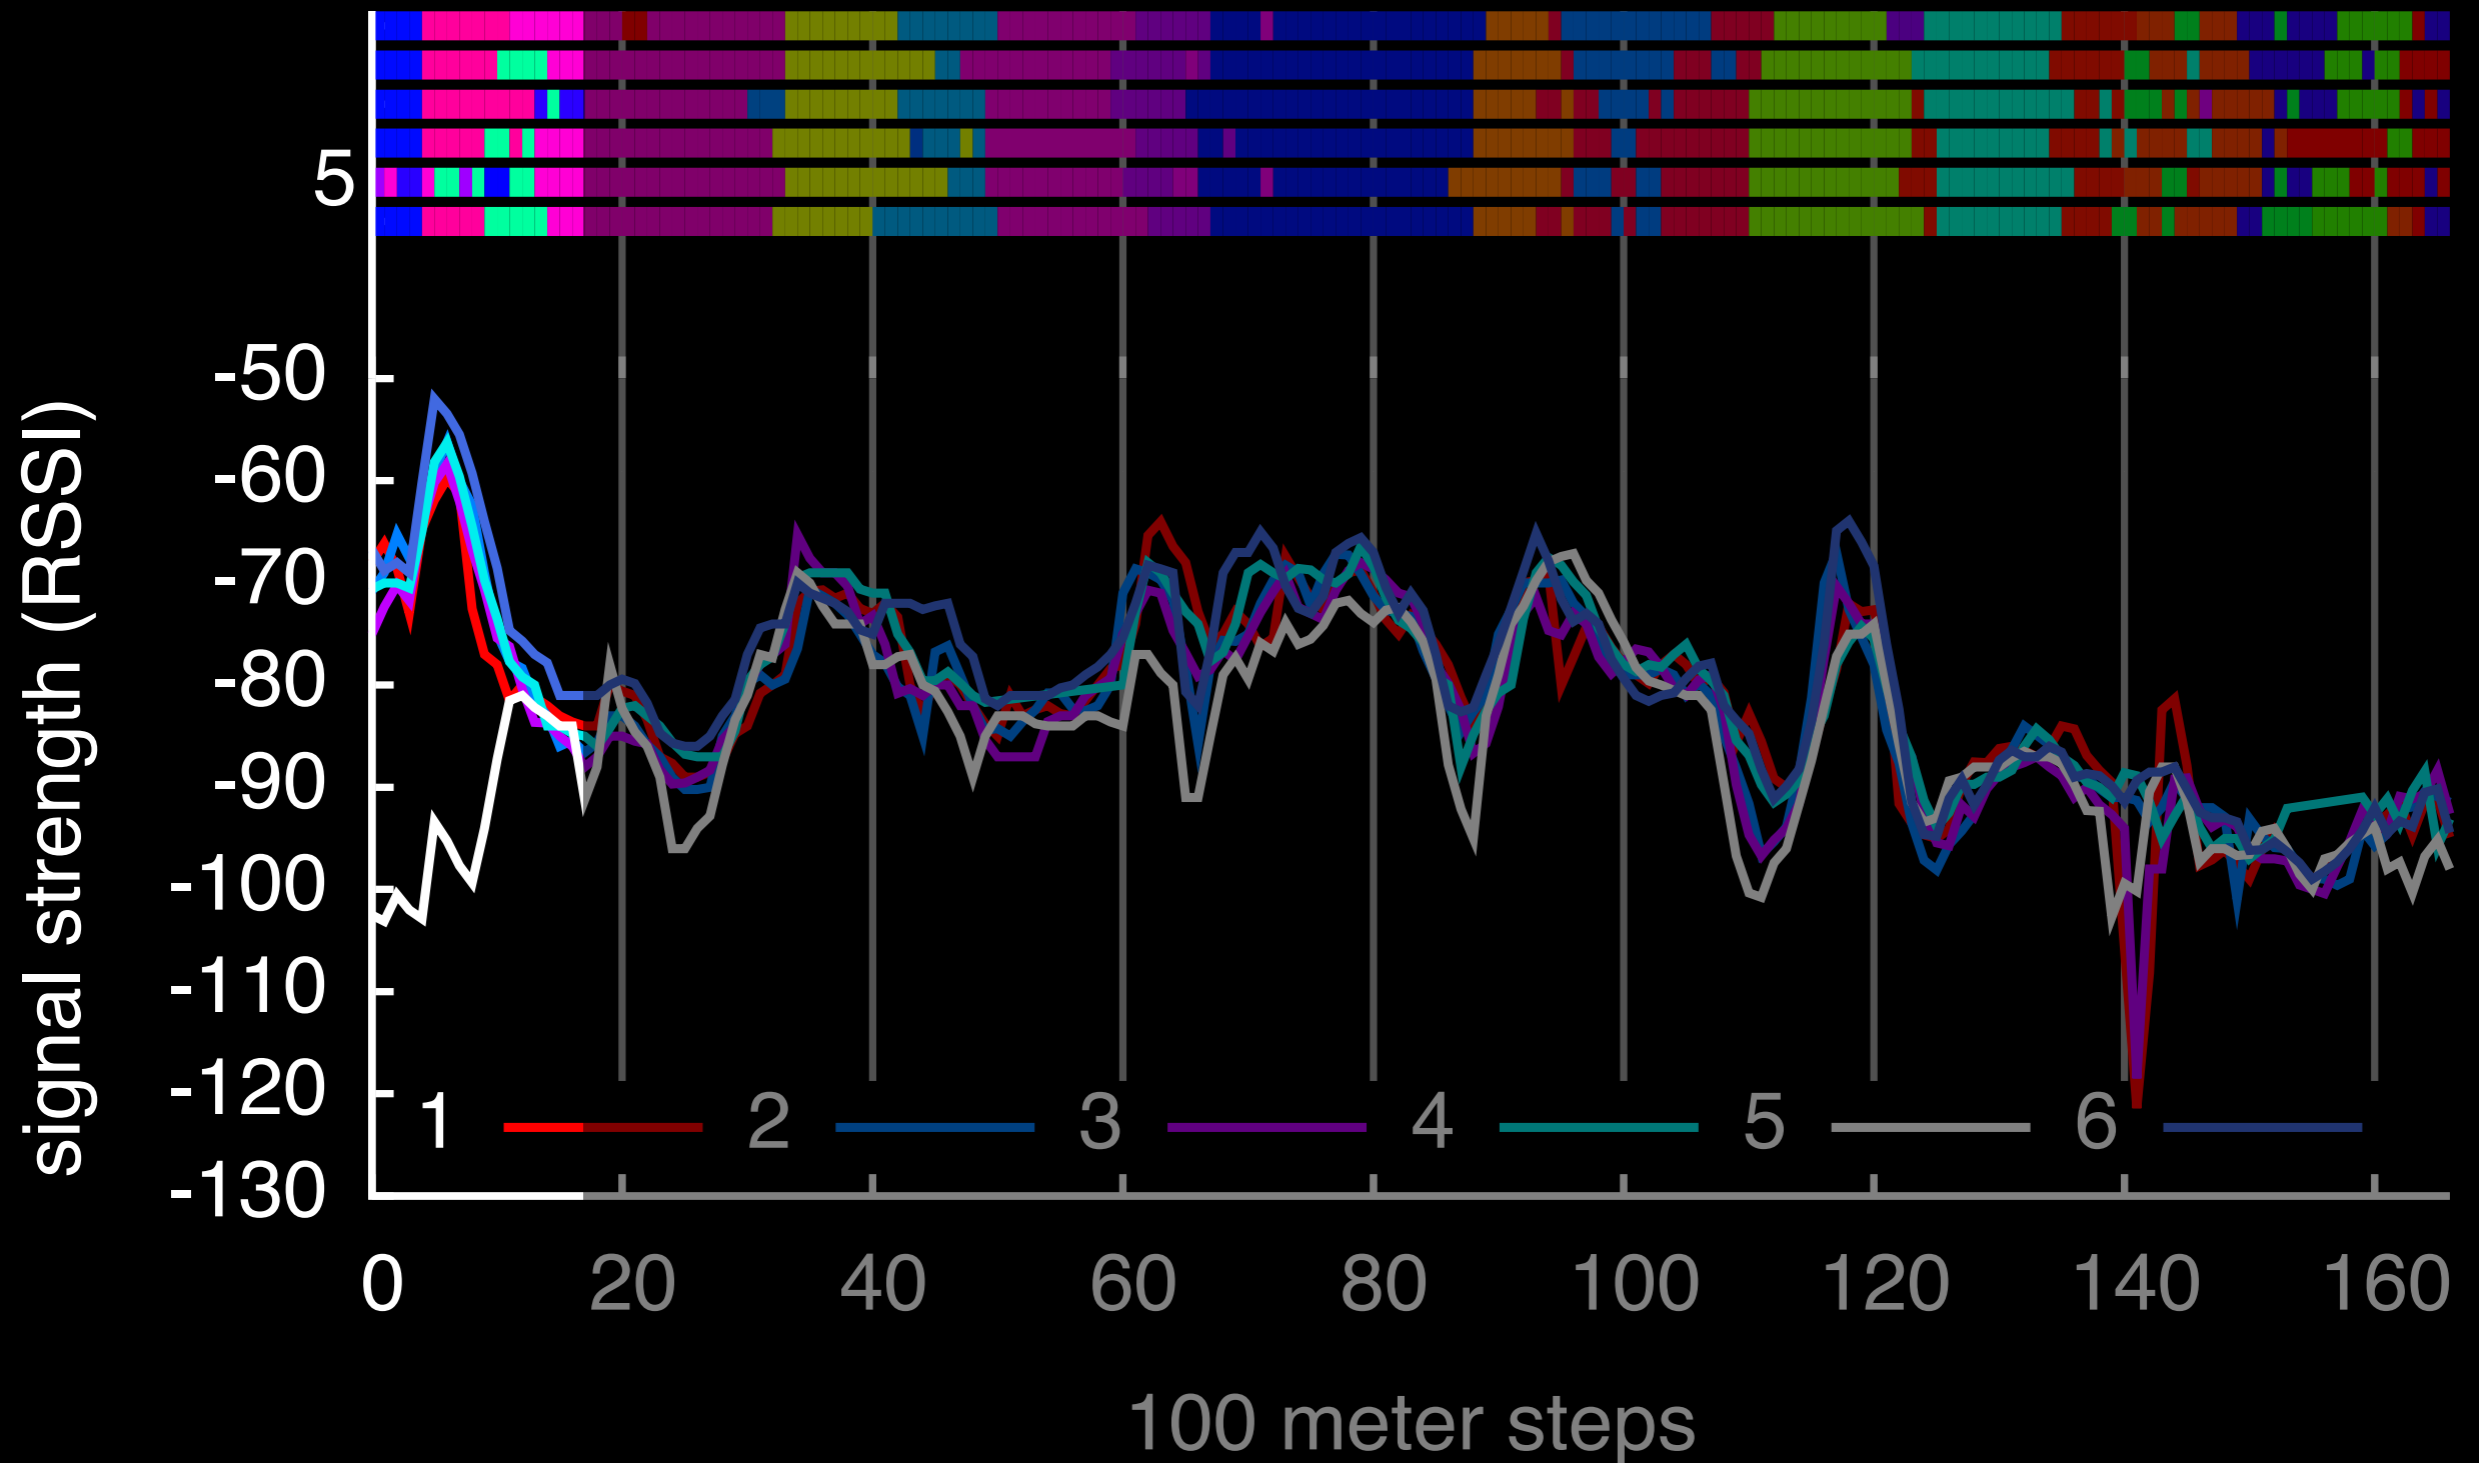

energy consumer	consumption	 Bartendr
<b>Signal prediction</b> locating the phone on a path (1D not 2 or 3D)	GPS is 400 mW and slow to fix, WiFi must be in receive mode	phone already maintains signal strength, cell id, and neighbor cells
<b>Sync scheduler</b> wakeup and sleep	1 J to wake up 0.5 J to sleep	schedule syncs minutes into the future
<b>Streaming scheduler</b> radio energy tail	3 - 10 s of radio power after communication (at least 400 mW)	consider the radio's power state when scheduling a stream

# Signal strength variation on a path

# Signal strength variation on a path

# Predicting signal strength with previous drives

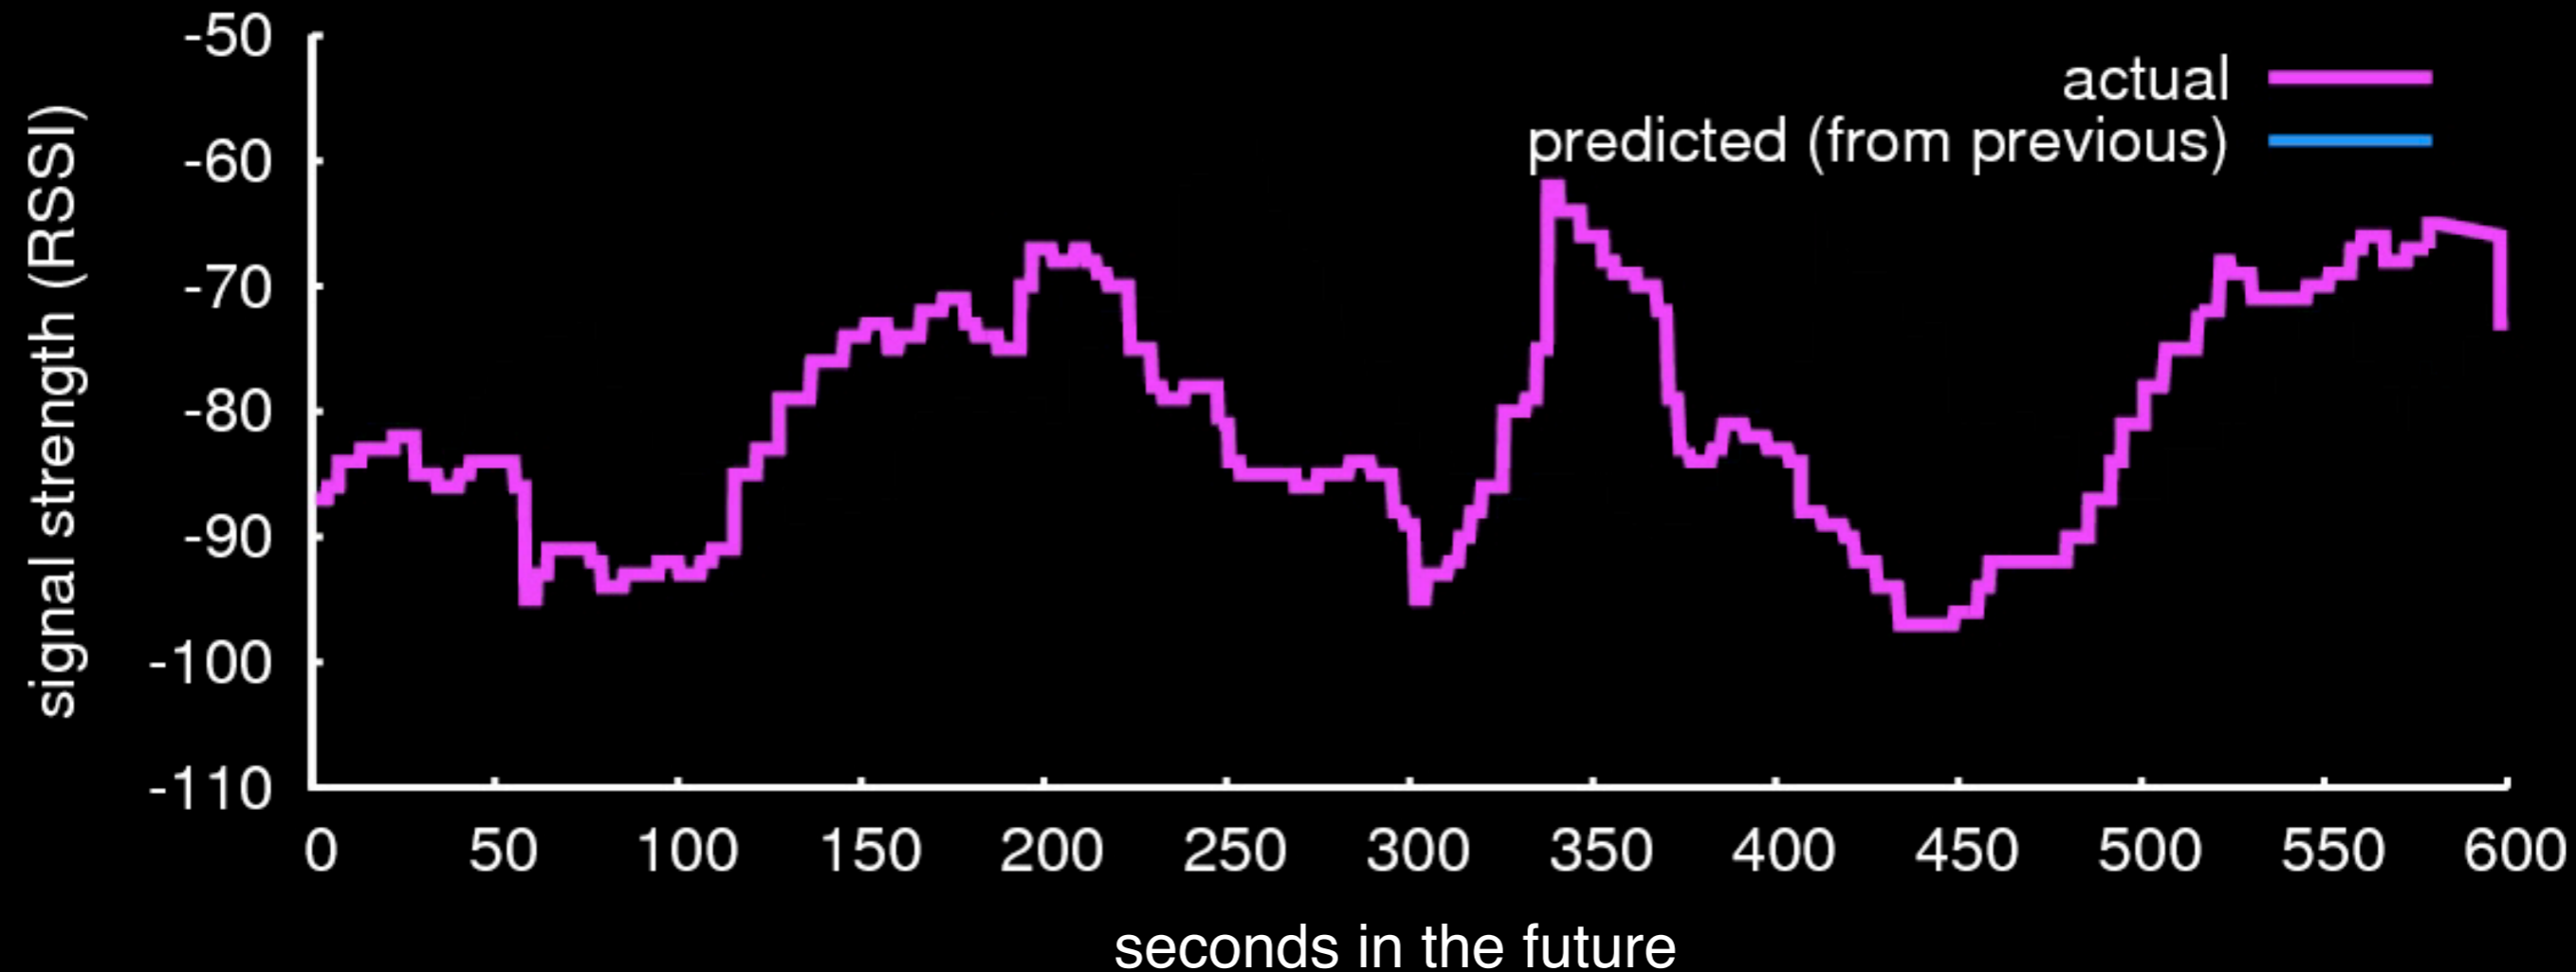

---

- 
1. Find location in a previous drive  
Signal strength, cell id, neighbor list
  2. Look ahead for future signal strength

seconds in the future

# Predicting signal strength with previous drives

1. Find location in a previous drive  
Signal strength, cell id, neighbor list
2. Look ahead for future signal strength

# Scheduling when to sync

Wake-up, sync, schedule, sleep

Uses threshold for efficient sync

Schedules for either **first** or **widest** signal

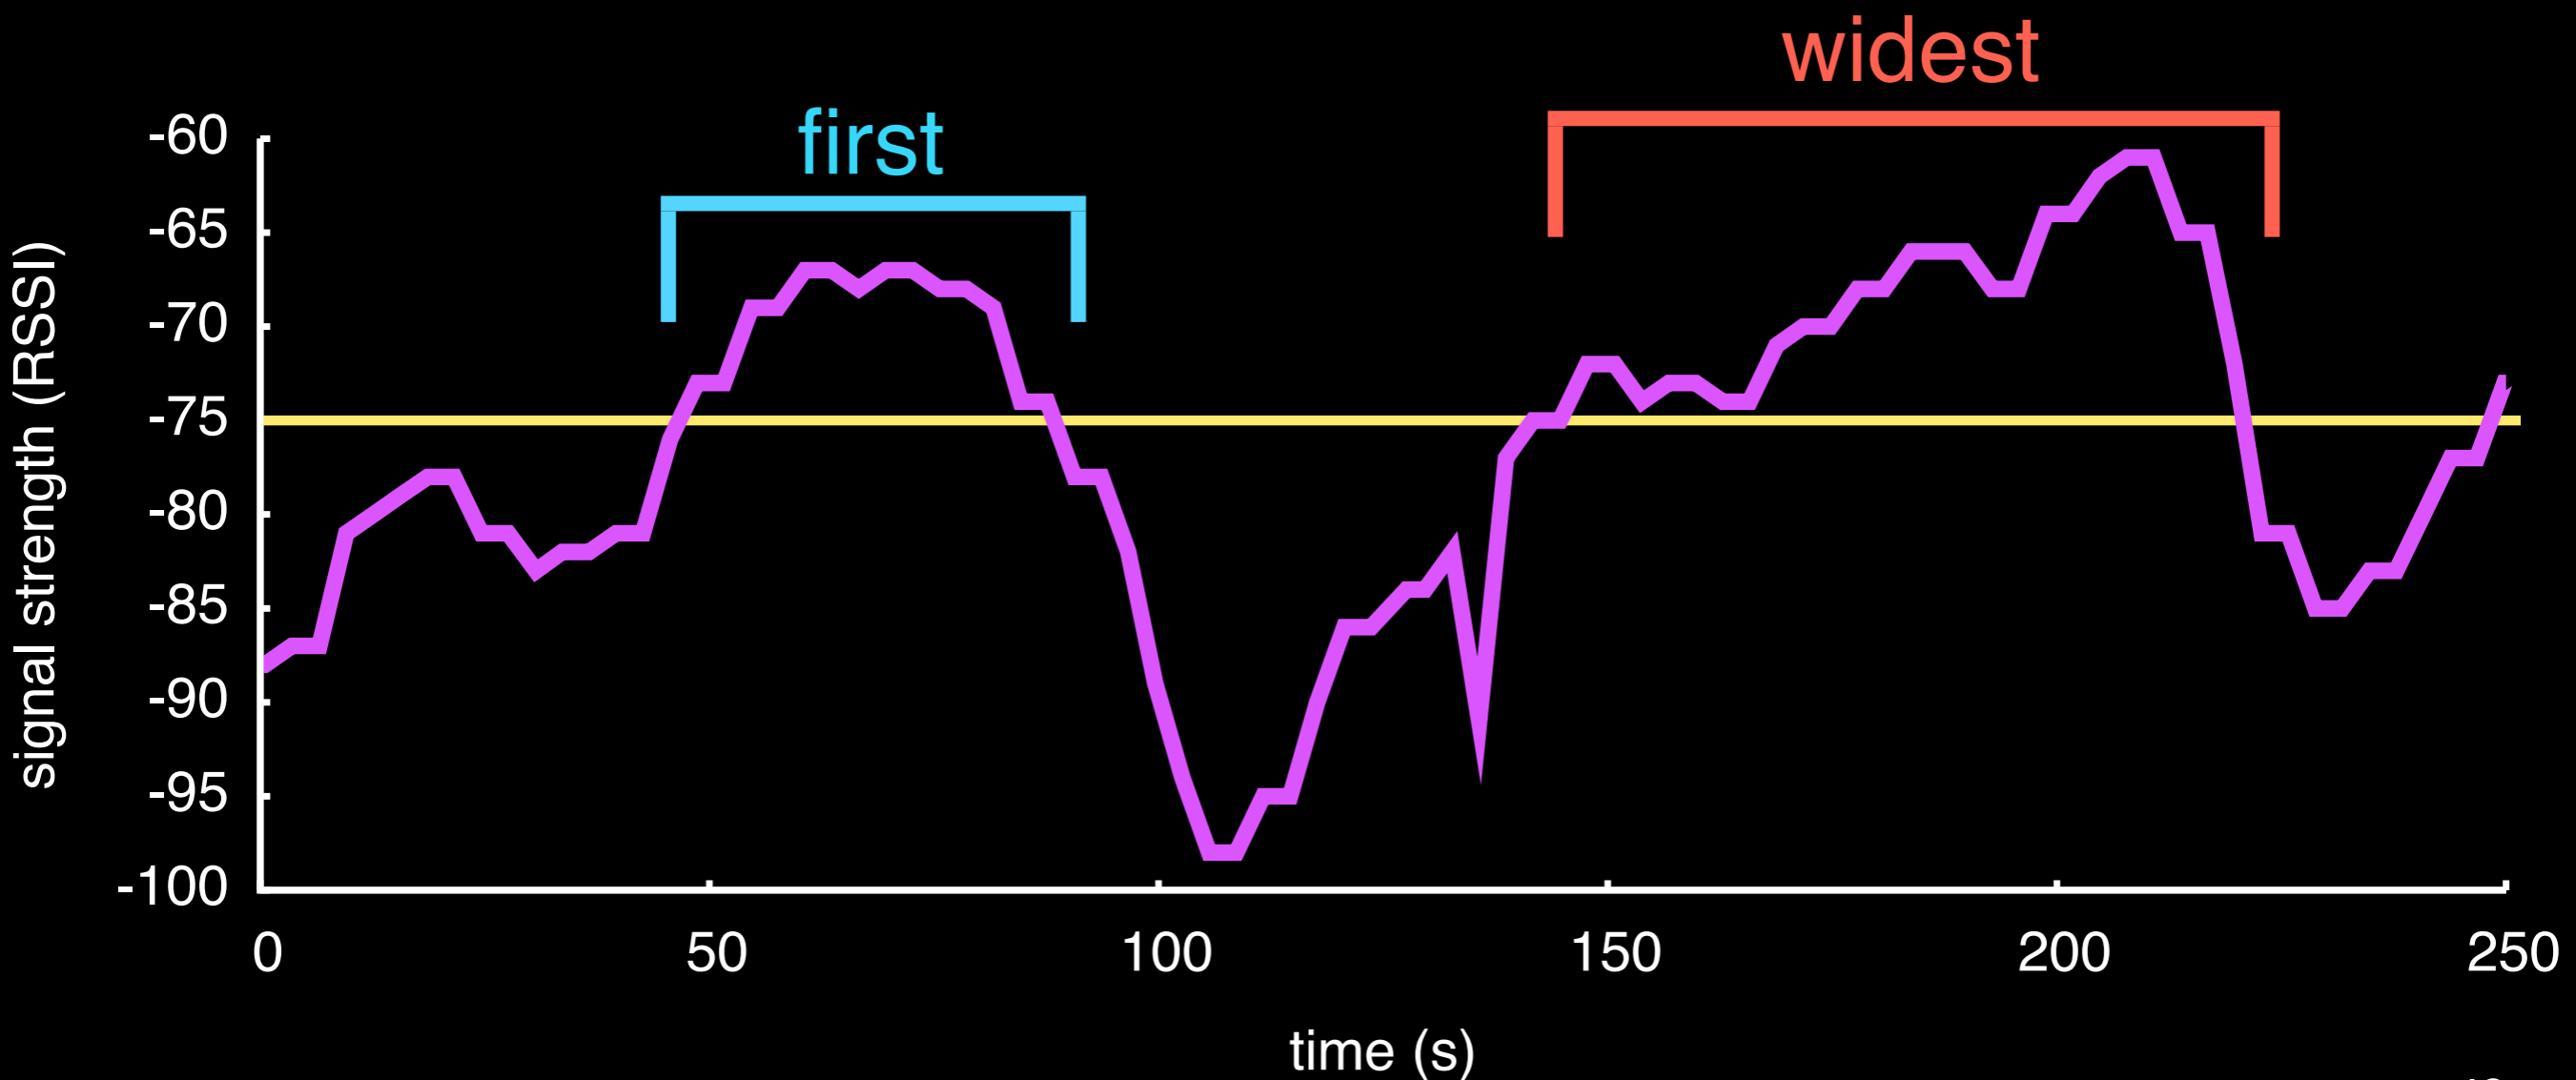

# Scheduling when to sync

Wake-up, sync, schedule, sleep

Uses threshold for efficient sync

Schedules for either **first** or **widest** signal

# Scheduling when to receive a stream

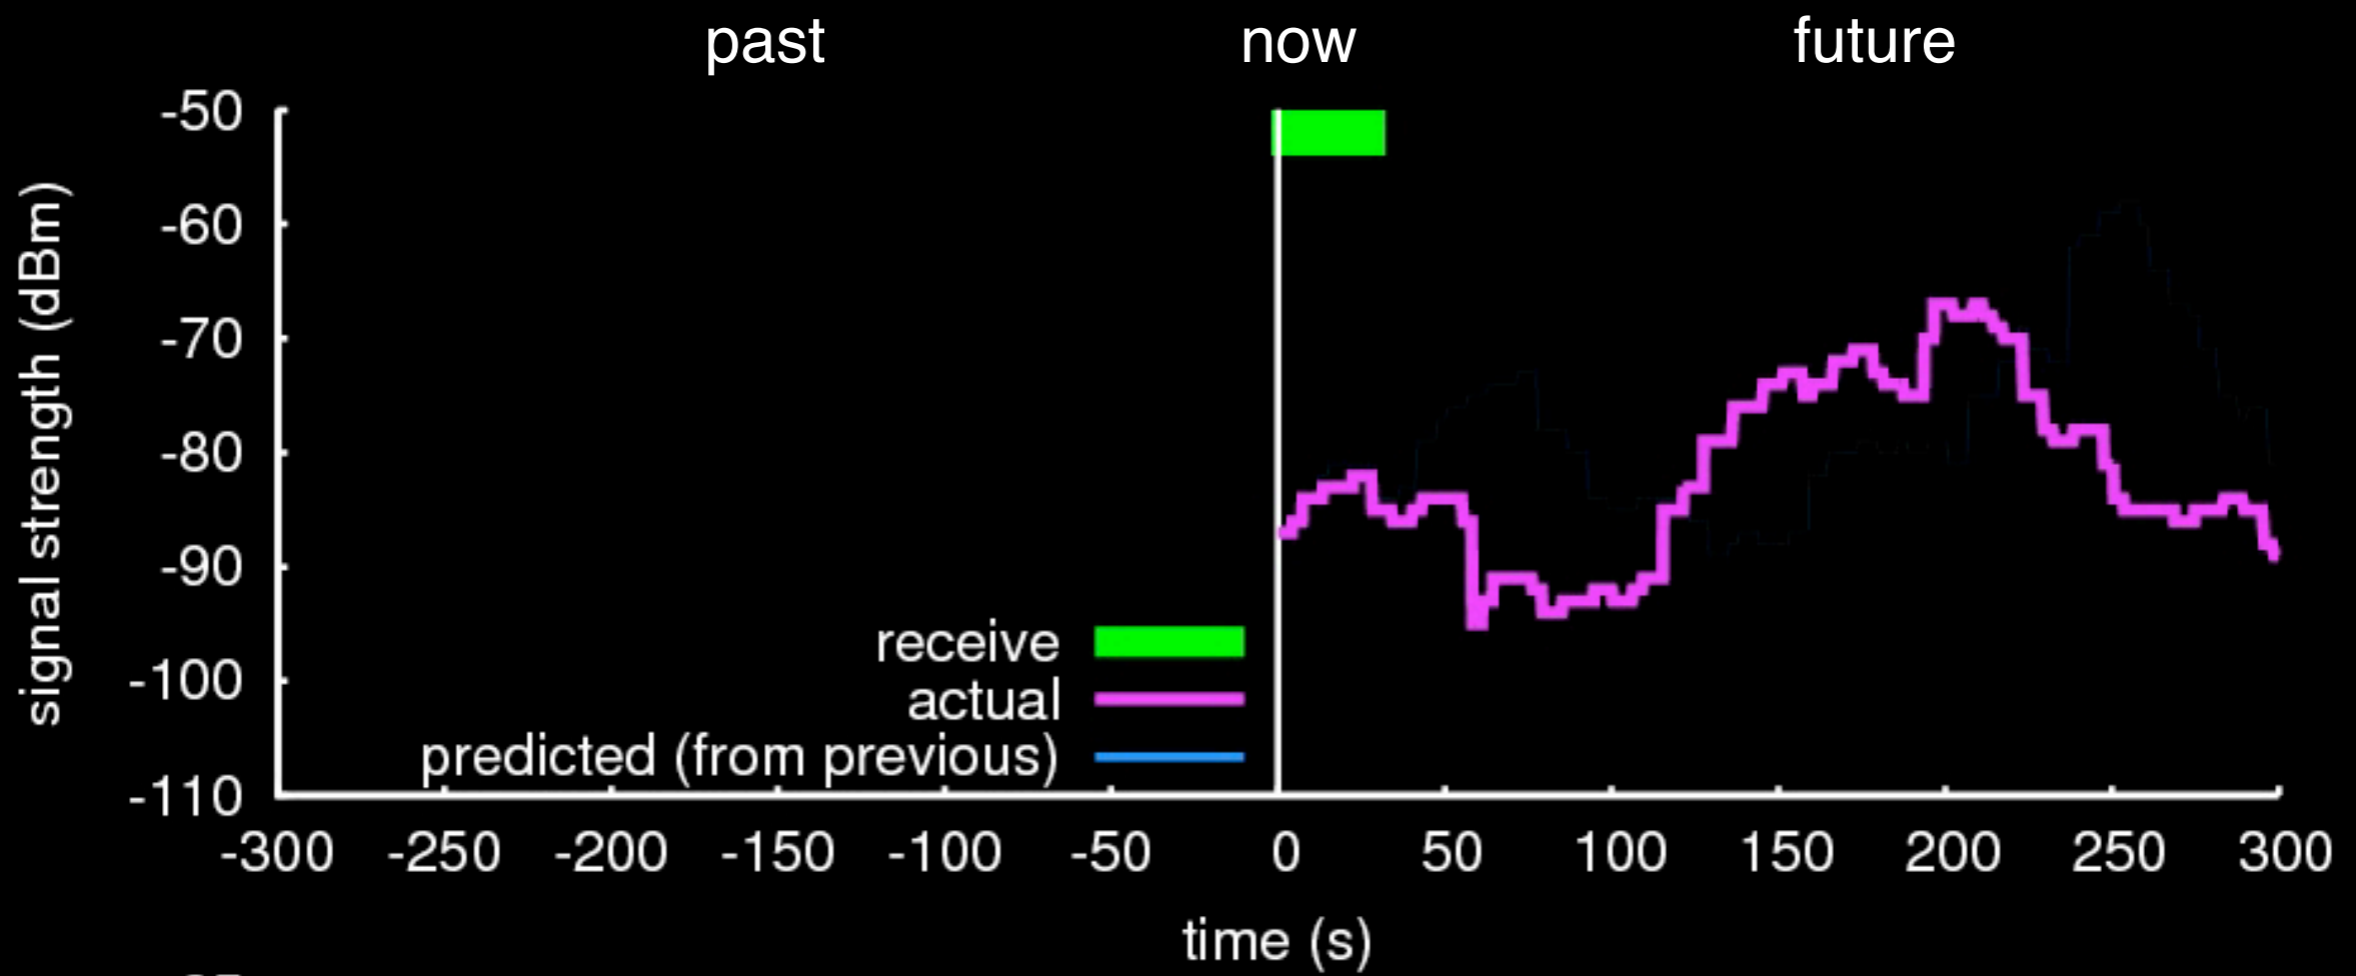

---

## Challenge

1. Tradeoff between strong signal and radio tail energy
2. Signal prediction error due to speed variations
3. Throughput prediction error due to congestion

## Approach

1. Minimize predicted energy - dynamic programming algorithm
2. Update schedule with latest signal prediction
3. Schedule based on remaining buffer

# Evaluation methodology

---

Simulated energy consumption of naive and scheduled syncs and streaming

Several 17 km drives of throughput and signal for prediction and simulation of energy consumption

Started at many points in the drive

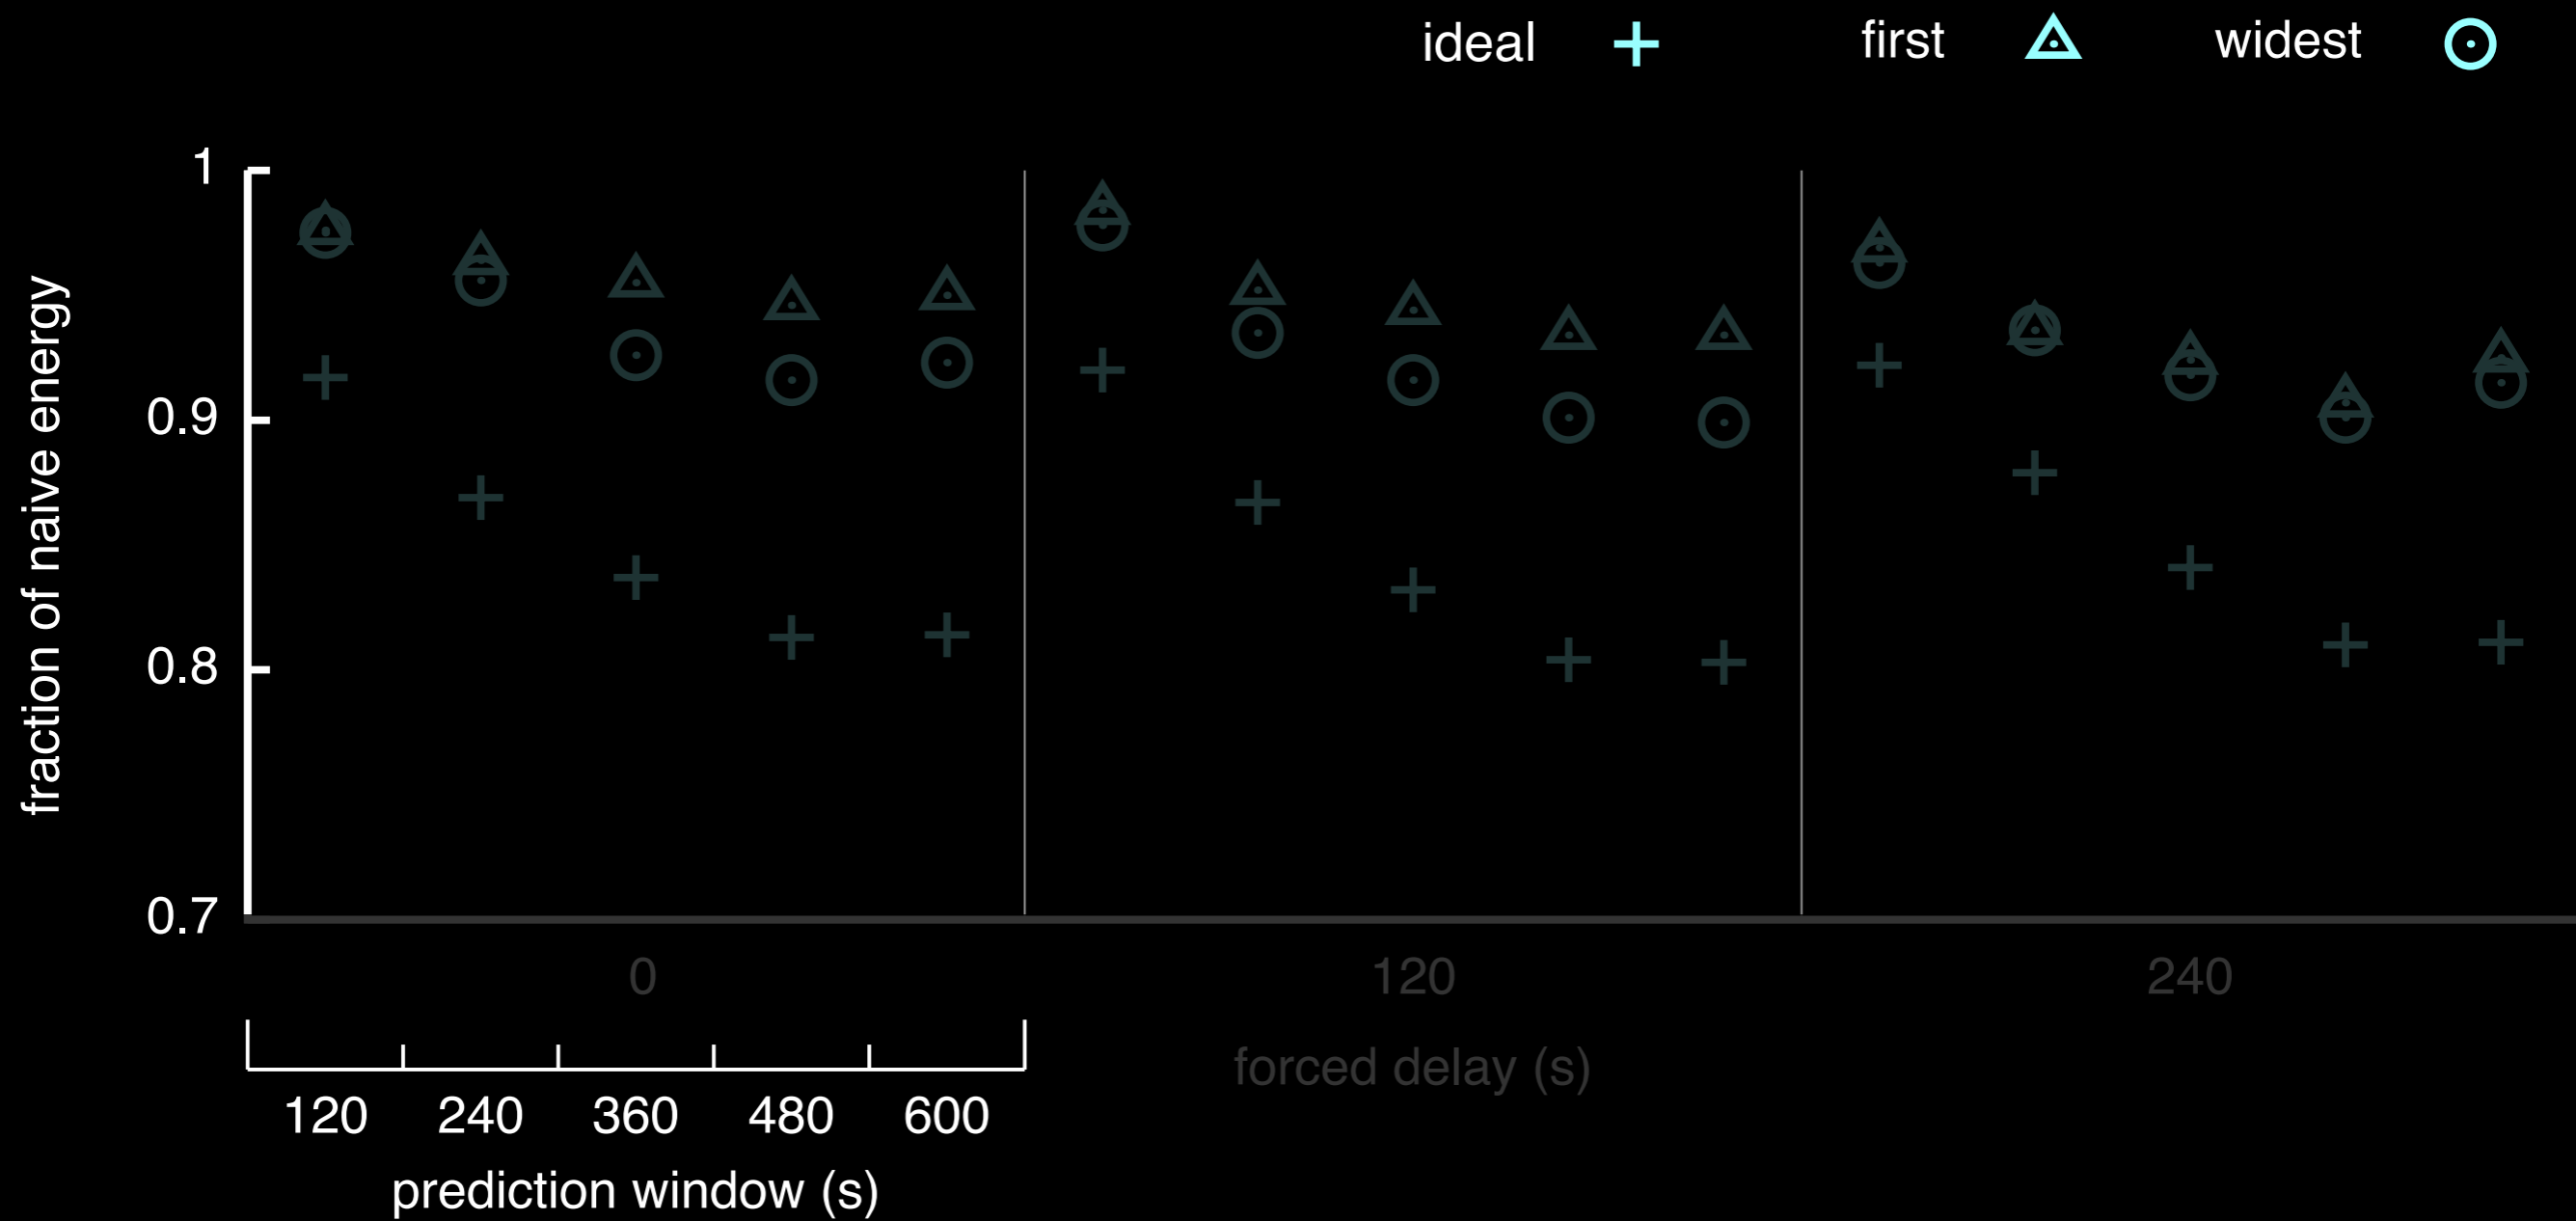

# Syncing simulation

# Last call

---

Signal strength affects energy consumption

Applications like sync and streaming can improve energy efficiency by deferring and prefetching

Previous drives can predict signal strength without breaking the energy bank

Scheduling can reduce energy consumption by up to 50% for large workloads and 10% for small
